

— THE LIVING WORKSPACE BLUEPRINT

STOP CARRYING *your whole business in your head.*

Most business owners are not behind because they don't know AI exists. They're behind because their AI setup has **no real structure**. This blueprint is the map.

A FIELD GUIDE BY

Gabriel Omat

WORKSHOP COMPANION
THE ATELIER · 02

— THE DIAGNOSIS

YOUR AI SETUP LOOKS *impressive* FOR ABOUT FIVE MINUTES.

A Custom GPT here. A Claude Project there. A few prompts saved somewhere. A Notion doc you forgot existed. A spreadsheet you meant to update every week. A pile of half-useful chats with no memory of what changed.

It all works for a minute.

Then your business moves.

Your offer changes. Your priorities shift. Your positioning evolves. A client asks for something new. You retire something. You launch something. You make a decision in a chat and then lose it forever.

And suddenly your AI setup is already stale.

So you go back to doing what most founders do:

You carry the whole business in your head.

That is exactly what a Living Workspace is designed to fix.

WHAT THIS BLUEPRINT GIVES YOU

THE MAP, NOT THE *build.*

This blueprint will help you understand:

- ◆ What a Living Workspace actually is
- ◆ Why normal AI setups go stale
- ◆ The four layers every Living Workspace needs
- ◆ How to begin building a simple version
- ◆ Why the system needs an update rhythm
- ◆ What usually breaks when people try to build this alone
- ◆ What comes later, once the foundation is working

This is not meant to be a full technical implementation manual.

The goal is not to build the perfect system in one afternoon.

THE GOAL

Understand the structure, start simple, and stop treating AI like a pile of disconnected tools.

WHAT IS A *Living Workspace?*

A Living Workspace is an AI-powered operating system for your business. It gives your AI the context it needs to help you think, plan, create, decide, and execute — without starting from scratch every time.

IT IS NOT

- ✦ A Notion database
- ✦ A second-brain content vault
- ✦ A giant prompt document
- ✦ A Custom GPT you uploaded once and forgot to update

IT IS

Designed to *stay current*. It holds who you are, what you sell, who you serve, your active offers, your brand voice, your priorities, your decisions, your tasks, your knowledge — and what has changed over time.

THE DIFFERENCE

*When you open AI to work on your business, it should already know where the business actually **is**. Not where it was three months ago. Not what your website used to say. Not every old offer you've ever sold all mixed together.*

THE STALE PROBLEM

WHY MOST AI SETUPS *stop working.*

AI needs context. Without context, it gives you generic answers.

That is why Custom GPTs, Projects, and knowledge uploads can feel exciting at first. You add your offers. Your audience. Your pricing. Your voice. Your documents. And for a while, it works better.

But then your business changes.

You change an offer. You test new messaging. You retire a package. You launch a workshop. You shift your niche. You raise your price. You make a strategic decision in a random chat.

And unless your AI setup has a way to *replace outdated information with current information*, it starts holding both.

- ♦ The old thing and the new thing
- ♦ The retired offer and the current offer
- ♦ The past strategy and the present strategy

That is when outputs get weird. Not because AI is useless. Because your system is stale.

Your business intelligence needs
a place to *live, update,*
and stay organized.

PART ONE · THE ARCHITECTURE

04

THE FOUR *layers*

A Living Workspace has four core layers. Each one has a different job. When you keep them separate, the system stays clean. When you mix them together, the system gets messy fast.

LAYERS 01 + 02

THE FRONT DOOR, AND THE *present.*

The Concierge

01

The front door to your workspace.

Your **CLAUDE.md** file — the instruction layer Claude reads before every session. It tells your AI who you are, what your business does, what matters right now, what terms you use, what's active, and where to find deeper information.

A directory, not a library. It points your AI to the right places. It answers: "Who is this person, what business are we working on, what matters now, and where should I look next?"

The Execution Layer

02

What you are doing right now.

Your **TASKS.md** file — where weekly priorities, current goals, active projects, and immediate focus live. This is how you stay current on what to focus on now and what's coming up next.

It answers: "What are we working on right now?" Without it, your AI may understand your business generally — but won't know what actually deserves attention this week.

LAYERS 03 + 04

THE DEPTH, AND THE *timeline.*

The Knowledge Layer

03

The deeper intelligence of your business.

Your **wiki** — a directory to all your saved business knowledge. Offers, audience insights, brand voice, frameworks, client patterns, sales messaging, positioning, competitive thinking, testimonials, important decisions, strategic rationale, repeatable processes.

This is the "why" layer. It helps your AI understand not just what you do, but how you think. It gives your AI doctrine — not just surface-level advice.

The Chronology Layer

04

What changed and when.

Your **LOG.md** file — the layer most people forget, and one of the biggest reasons AI setups go stale. If your AI can read a document but doesn't know whether the information is from last week or last year, it doesn't know what to trust.

It answers: "*What changed, when did it change, and what did it replace?*" This is the layer that keeps your workspace honest.

Routing is the Concierge. Execution is *now*.
Knowledge is *why*. Chronology is *when*.

— IN PRACTICE

HOW THE FOUR LAYERS WORK *together.*

When you open a new AI conversation, your workspace should help your AI understand four things, in this order:

- 01 **Who you are** and what matters
- 02 **What you are focused on** right now
- 03 **What deeper business knowledge** applies
- 04 **What has changed** recently

That means your AI does not need to be overloaded with everything all at once. It needs the *right information in the right order.*

THE ARCHITECTURE

Each layer has a job.

- 01 **The Concierge** points the way.
- 02 **The Execution Layer** gives current focus.
- 03 **The Knowledge Layer** gives depth.
- 04 **The Chronology Layer** gives recency.

Together, those layers create context. *And context is what makes AI useful.*

PART TWO · THE BUILD

05

YOUR MINIMUM VIABLE *workspace.*

You do not need a giant system to start. In fact, trying to build too much at the beginning is one of the fastest ways to never use it. Start with five things.

BUILD IT LEAN

FIVE THINGS. THAT'S THE *whole start.*

01 Your Workspace Folder

Choose a name and save it where you save your important folders. Once you've chosen your name, don't change it. **This name becomes a path for most workflows you build for your business.**

02 A Concierge File

This is your **CLAUDE.md** file — the document Claude reads before every session starts. It acts as the front door to your workspace: a short business overview, who you serve, what you sell, your current focus, your most important terms, your working preferences, and where deeper context lives. *Keep it lean.* If a section gets too long, that's usually a sign it belongs in the Knowledge Layer instead.

03 A Current Work File

This is your **TASKS.md** file — one place to track what matters now: this week's goals, current priorities, active projects, immediate next actions, parked ideas, waiting-on items. **If it's active this week, it belongs here. If it's not active, it belongs somewhere else.**

04 A Business Knowledge Area

This is your **wiki** — the directory to all your saved business knowledge. *Start small.* A few topics: offers, audience, brand voice, messaging, content themes, client insights, sales process, frameworks, testimonials, decisions. Don't try to write 30 documents on day one. A good Knowledge Layer grows from use.

05 A Change Log

This is your **LOG.md** file — one place to capture what changes: what changed, why, when, what it replaced, what needs to be updated because of it. **This is the heartbeat of the Living Workspace.** Without a change log, your workspace becomes a storage cabinet. With one, it becomes a living system.

THE UPDATE RITUAL

When something meaningful changes, ask four questions.

- 01 What changed?
- 02 Why did it change?
- 03 What does this replace or retire?
- 04 What needs to be updated because of this?

The most important question is: *What does this replace or retire?* Most people only add. They never subtract. And if you never tell your AI what is no longer true, it will keep treating outdated information as valid. That's how your AI setup quietly starts lying to you. Not maliciously. Just because nobody cleaned up the context.

— THE WEEKLY RHYTHM

FIFTEEN MINUTES, ONCE A *week*.

You don't need a complicated maintenance system. Once a week, take 15 minutes and review:

- ◆ What are my top 1 to 3 priorities this week?
- ◆ What changed last week?
- ◆ What decisions did I make?
- ◆ What needs to be updated?
- ◆ What is no longer active?
- ◆ What should be moved out of focus?
- ◆ What does my AI need to know before helping me this week?

That's it. The goal is not perfect documentation. *The goal is current context.*

IN PRACTICE · MONDAY MORNING

Instead of opening AI and explaining your business again, you open your Living Workspace. Your AI already knows what you sell, who you serve, what offer is active, what project is the main focus, what metrics matter this month, what decisions you made last week, what's parked for later, and what old direction has been retired.

So when you ask, "*What should I focus on this week?*" — you're not getting generic advice. You're getting a response grounded in your actual business.

That's the compound return. **Every update makes future conversations sharper.**

PART THREE · THE PITFALLS

WHAT USUALLY *breaks.*

Most people don't fail because they're bad at AI. They fail because they accidentally create a system too messy, too big, or too stale to use. Here's what to watch for.

THE MISTAKES

WHAT BREAKS A LIVING *Workspace.*

MISTAKE 01

Building one giant file.

The most common mistake. People put offers, tasks, audience, strategy, ideas, decisions, content themes, project plans — everything — into one massive document. At first it feels easier. Then it becomes unusable. *Each layer has a different job. Don't make one file do all of them.*

MISTAKE 02

Adding without pruning.

Most people love adding context. They hate removing old context. But stale information isn't harmless. If your AI sees three old offers and one current offer with no clear signal about what's active, it may use the wrong one. Every time something changes, ask: *What is no longer true?*

MISTAKE 03

Capturing decisions later.

"I'll update this later" is usually a lie. Not because you're lazy — because you're busy. The best time to capture a decision is when it happens. If you wait three weeks, you may remember the decision but forget the reasoning. **And the reasoning is often the most valuable part.**

MISTAKE 04

Mixing current tasks with long-term knowledge.

Your weekly priorities should not live in the same place as your brand philosophy. Your content strategy should not be buried next to your errands. Your decision history should not be mixed with random brainstorm.

Different types of information need different homes. Current work changes quickly. Business knowledge changes more slowly. Decision history needs a timeline. *That is why the layers exist.*

MISTAKE 05

Building too much before using it.

You don't need a perfect workspace to begin. You need a useful one. Start with the four layers. Use them. Then improve them. **A Living Workspace gets better through use, not through endless setup.**

Each layer has a job.
Keep them *separate*.
Keep them *connected*.
Keep them *updated*.

— IF YOU WANT TO START YOURSELF

THE SEVEN STEP *path.*

01

CHOOSE ONE WORKSPACE HOME

Pick one place where your AI can access your business context.

02

CREATE YOUR CONCIERGE *CLAUDE.md*

A short orientation file: who you are, what you do, who you serve, what matters now, where to look for deeper context.

03

CREATE YOUR CURRENT WORK FILE *TASKS.md*

List your top 1—3 weekly goals, active projects, and immediate next actions.

04

CREATE YOUR BUSINESS KNOWLEDGE AREA *the wiki*

Start with a few key topics: offers, audience, voice, messaging, client insights, decisions.

05

CREATE YOUR CHANGE LOG *LOG.md*

Capture what changed, why it changed, and what it replaces.

06

USE THE UPDATE RITUAL

Every meaningful change: What changed? Why? What does this replace? What needs to be updated?

07

REVIEW WEEKLY

Once a week, review your priorities, updates, decisions, and stale context.

That is your minimum viable Living Workspace. Not perfect. But working.

— THE EXPANSION

WHEN THE FOUNDATION *exists.*

Once the foundation is built and you're actually using it, you can layer in more powerful upgrades. This is where the workspace becomes more than memory. **It becomes a business operating system.**

ADVANCED LAYERS CAN INCLUDE

- ◆ A visual command center
- ◆ Custom workflows
- ◆ Claude Skills
- ◆ Scheduled tasks
- ◆ Morning review rituals
- ◆ Metric tracking
- ◆ Connected data sources
- ◆ Client delivery workflows
- ◆ Content pipelines
- ◆ Sales follow-up systems
- ◆ Launch planning workflows
- ◆ Weekly CEO reviews
- ◆ Team handoff systems
- ◆ Multi-AI workflows

A WORD OF WARNING

Do not start here. These layers work best after the foundation exists. The foundation is what gives the advanced pieces enough context to actually work.

THE HONEST PART

THE CONCEPT IS SIMPLE. THE BUILD IS *where most get stuck.*

This blueprint gives you the map. It shows you the four layers, the core rhythm, and the mistakes to avoid. You can absolutely use this to begin building a simple version yourself.

Start small. Keep it clean. Use it weekly. Let it grow from real decisions and real work.

But here's the honest part: building a useful Living Workspace requires several decisions most people get stuck on.

- ♦ What should your AI know?
- ♦ What should it ignore?
- ♦ What belongs in the Concierge?
- ♦ What belongs in the Knowledge Layer?
- ♦ What is current?
- ♦ What is stale?
- ♦ What workflows should you build first?
- ♦ What parts of your business should connect?
- ♦ What should be automated?
- ♦ What should stay manual?
- ♦ How do you keep the system clean over time?

That is where support matters.

— THE LIVING WORKSPACE INTENSIVE

IF YOU WANT THE THING *built.*

The **Living Workspace Intensive** is for business owners who don't just want the concept — they want the thing built. Together, we build your Living Workspace inside Claude: your Business Brain, your task system, your knowledge structure, your change log, your visual command center, and the workflows that match how you actually work.

PRIVATE 1:1
BY APPLICATION

WHAT'S INCLUDED

- ♦ Four private 1:1 implementation calls with G
- ♦ The Living Workspace Starter System
- ♦ The full Chat Sweep command
- ♦ 30 days of async Loom + Slack support during the build
- ♦ 30 additional days of Slack support after
- ♦ 11 Custom Claude Skills

PRIVATE 1:1 · REFUND GUARANTEE

THE BLUEPRINT SHOWS THE MAP.
THE INTENSIVE BUILDS THE SYSTEM.

— THE FINAL PRINCIPLE

YOUR BUSINESS SHOULD NOT LIVE ENTIRELY IN *your head.*

And your AI should not be working from stale context. A Living Workspace gives your business intelligence a place to *live*, *update*, and turn into action.

- 01 Start simple.
- 02 Keep the four layers clean.
- 03 Capture what changes.
- 04 Prune what is no longer true.
- 05 Review weekly.

When you do, AI stops feeling like a random assistant you have to brief every time. It becomes a workspace that already knows.

A WORKSPACE THAT *already* *knows.*

The blueprint shows you the map. The Living Workspace Intensive helps you build the system around your actual business — your tools, your offers, your workflows, your voice, and your priorities.

Spots open in small rounds throughout the year. Apply when you're ready and we'll talk about whether it's the right fit.
